

Texas Healthcare Workforce Access & Community Need Dashboard

County-level indicators for community health, shortage designations, workforce supply, facility access, and underserved areas

Community Health Burden

Compares chronic disease and health outcome indicators across Texas counties.

Prevention & Access Indicators

Highlights prevention, screening, dental care, routine checkup, and insurance access measures.

Risk Behavior Profile

Ranks counties by selected behavioral risk indicators such as smoking, inactivity, and short sleep.

Health Status Profile

Shows county variation in self-rated health and physical or mental health distress.

County Workforce & Facility Context

Compares county-level provider supply, hospital capacity, and rural/urban context.

AHRF County Profile

Lets users select a county and compare its workforce/facility access against Texas benchmarks.

Workforce Shortage Summary

Summarizes HRSA primary care, dental, and mental health shortage designations.

Medically Underserved Profile

Highlights MUA/P designations and IMU-based underservice patterns.

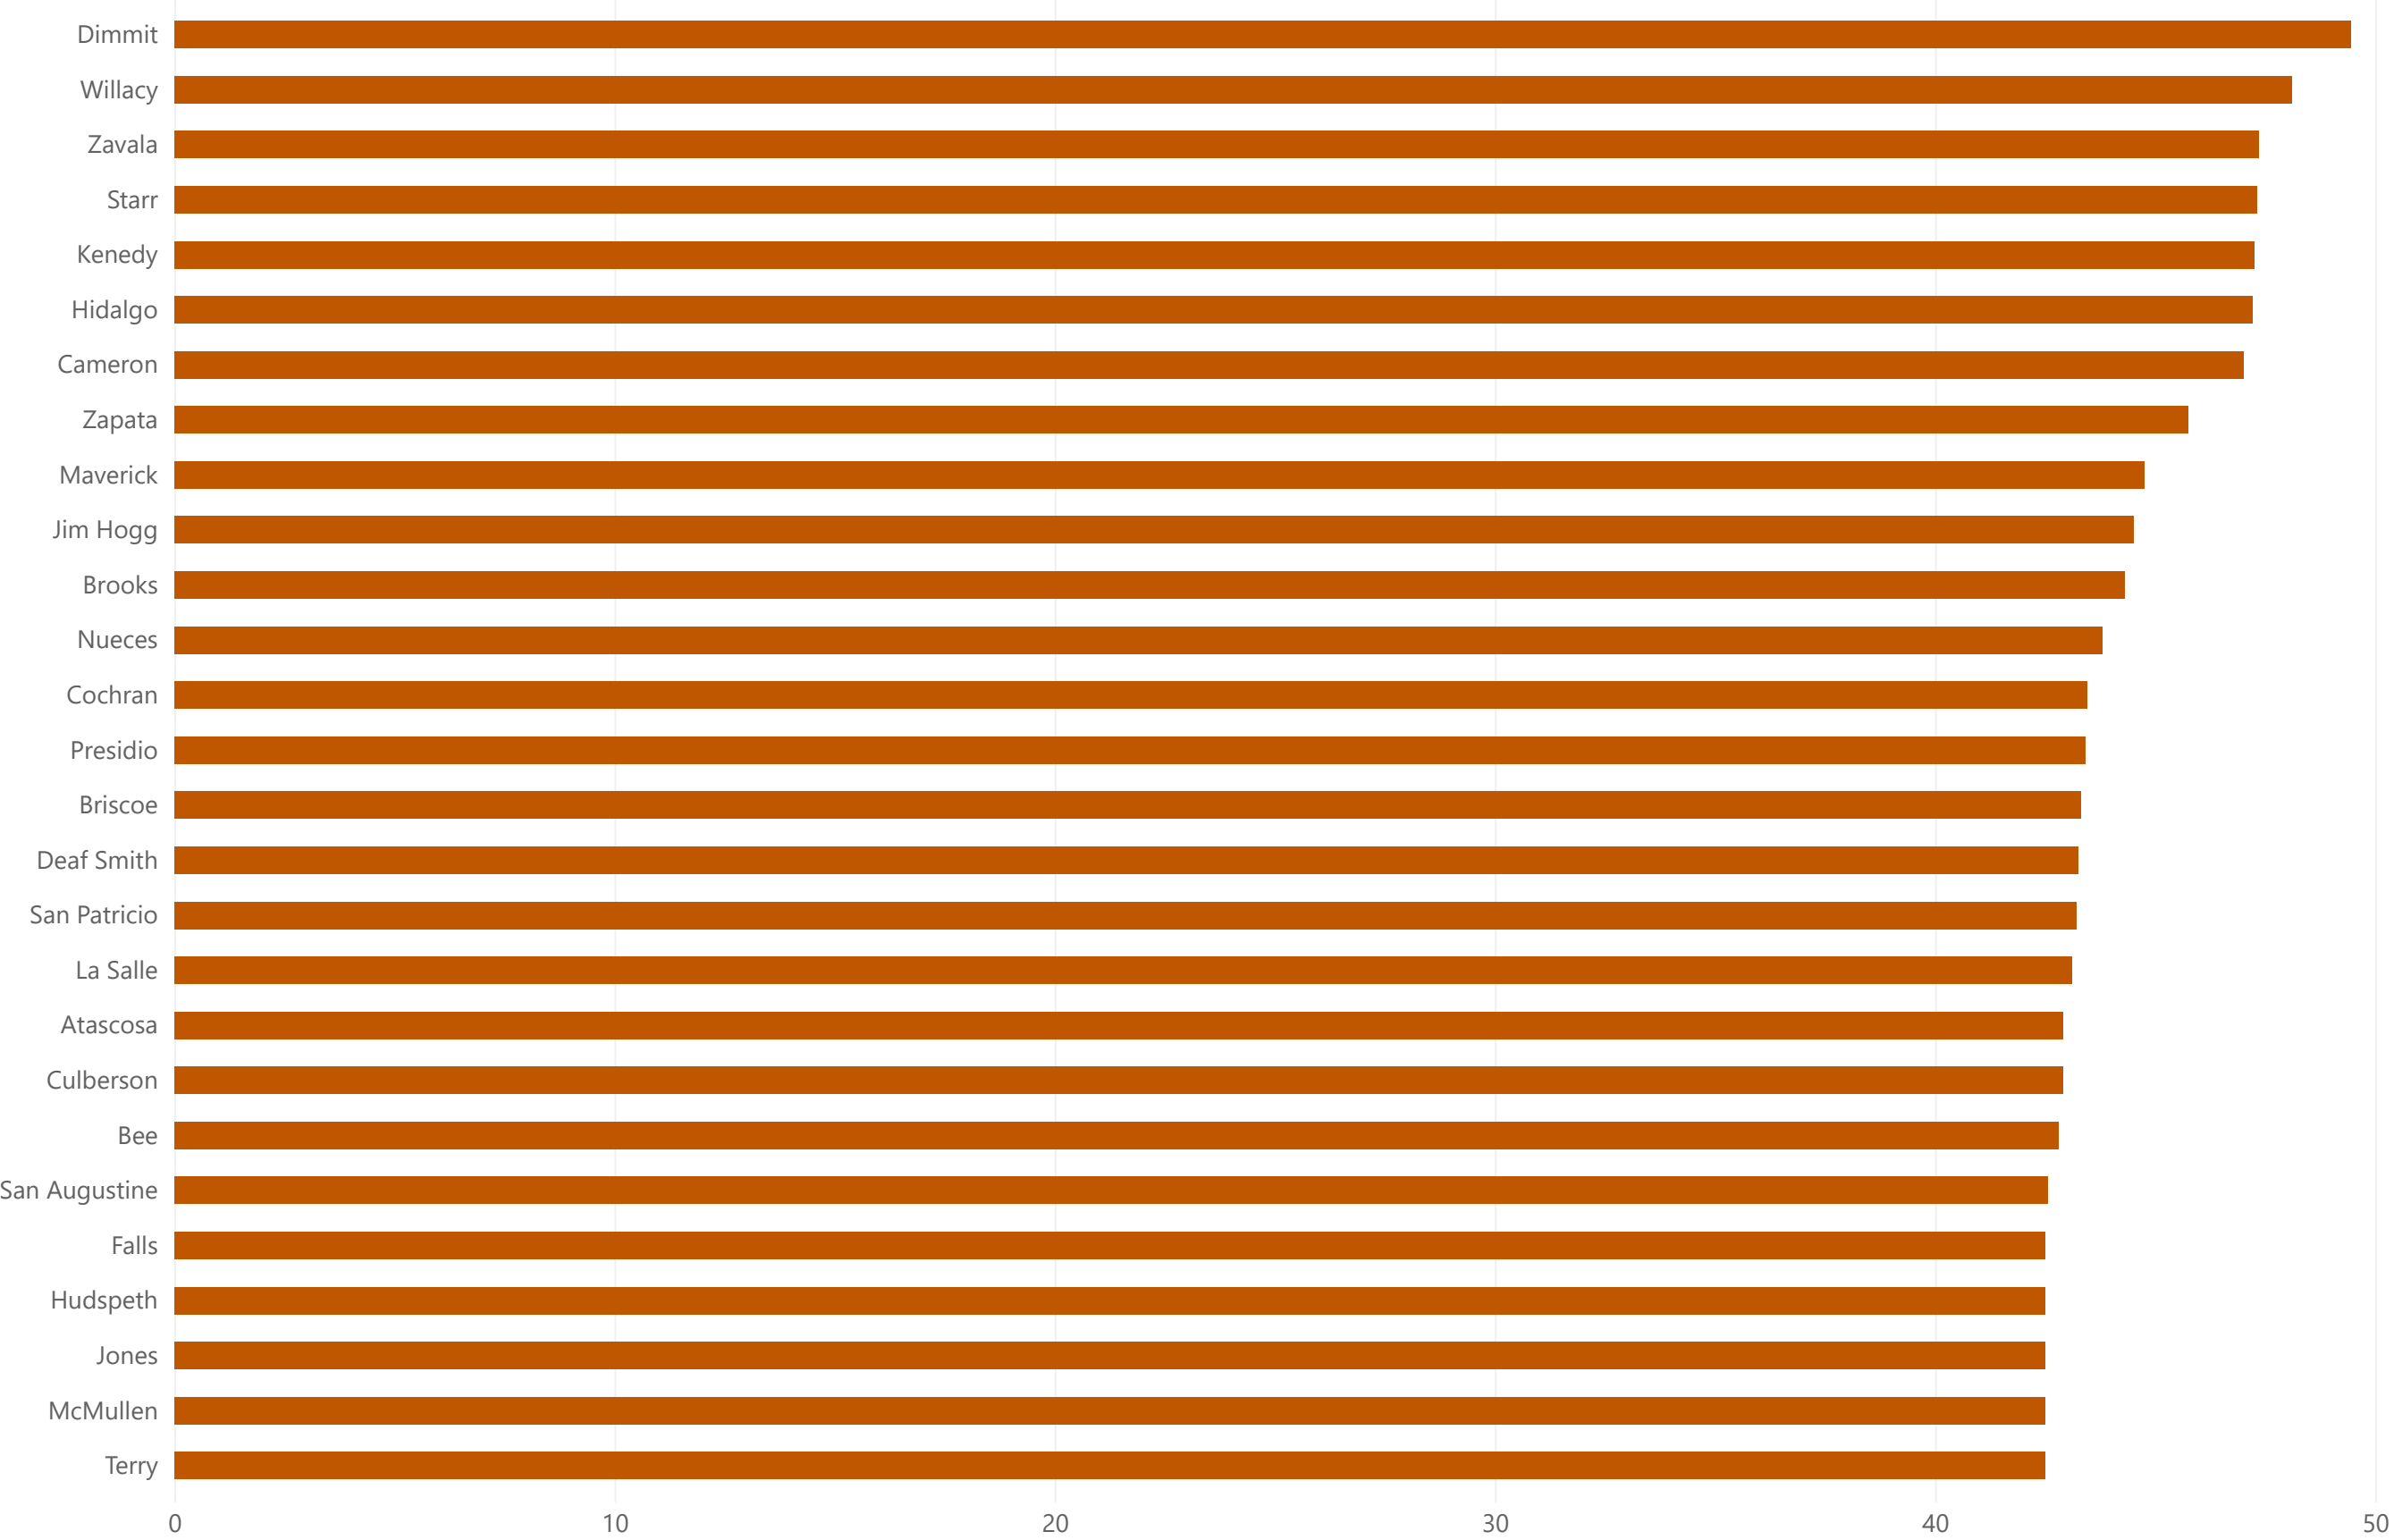

Community Health Burden by Texas County

Measure

Obesity among adults

Selected County Value vs Texas Benchmark Value

Note: Texas benchmark values are statewide comparison rates. Selected county values update based on the county slicer.

Methodology & Data Notes

Geographic Scope

Texas counties

Data Sources

CDC PLACES 2024 County Data

County-level health outcomes, prevention/access indicators, risk behaviors, and health status measures.

HRSA HPSA / MUA-P Data

Primary care, dental, and mental health shortage designations, provider shortage estimates, HPSA scores, and medically underserved area/population indicators.

AHRF County Workforce & Facility Data

County-level workforce, facility, population, rural/urban, uninsured, and poverty context.

Methodology

Measures are analyzed at the county level. CDC PLACES values are modeled estimates and are used as directional community health indicators. HRSA shortage data is used to identify provider shortage designations and underserved areas. AHRF data is used to compare workforce supply and facility access across counties. Provider and facility rates are calculated per 10,000 residents using AHRF county population estimates.

Limitations

Results should be interpreted as directional indicators rather than exact clinical counts. Data sources use different collection years, methodologies, and reporting definitions. Workforce and facility measures may not fully capture local access barriers such as transportation, insurance coverage, appointment availability, or within-county provider distribution.
